

Universal Credit Hub

Bank meeting readiness and delivered controls - 29 July 2026

Meeting position

UCH is ready to demonstrate a controlled bank operating model. It is not represented as a live core-banking system, regulator filing service, or autonomous credit/provisioning decision engine. The bank remains the decision-maker and system of record.

Area	What is demonstrable now	Control boundary
NPL early warning	Live arrears/status/restructure signals, collections handoff, pilot data-quality gate.	Requires bank-approved loan tape/core feed for a pilot.
Ghana macro risk	Dated inflation, policy rate, FX and cashflow observation submitted then independently approved.	Approved guidance only; no automatic lending/provisioning change.
Fraud and failed payments	Transaction screening with auditable human-review hold; transaction-resolution cases.	UCH does not move, block, or reverse bank funds.
Prudential and evidence	Maker-checker snapshots, evidence packs, filing-reference trail.	Not a claim of regulator submission or acceptance.
Security controls	Role scopes, MFA/TOTP, WebAuthn enrolment, lockout, audit trail, country/organisation scope.	Production tenant configuration and independent test still required.

Recent remediation and build work

- Encrypted borrower National ID search repaired without weakening at-rest encryption; authorised scope is applied before matching decrypted results.
- Authenticated E2E fixtures made deterministic; borrower-card selectors aligned to the current UI.
- Safari/WebKit E2E issue diagnosed and fixed: local HTTP assets are no longer upgraded to HTTPS by CSP in the isolated test environment. Production retains HTTPS upgrading.
- Cross-browser diagnostics now retain screenshot, video and trace on failure; the full pre-feature regression run passed.
- Ghana macro-risk observations now use the existing maker-checker approval and audit trail rather than an ungoverned configuration store.

Authentication and SSO truth

Real username/password accounts, mandatory MFA policy, TOTP recovery controls and passkey enrolment are implemented. Google and Microsoft institutional sign-in are code paths that require each bank's client ID, secret, approved redirect URI and provisioned staff identities. SAML enterprise SSO is deliberately unavailable until a vetted implementation and bank IdP metadata/certificate are supplied. Therefore no live SSO should be claimed before a bank tenant acceptance test.

Required before a live bank pilot

- Bank tenant configuration: named users, roles, country/organisation scope, MFA policy and least privilege.
- Bank-owned IdP configuration and user acceptance test for Google, Microsoft Entra or a vetted SAML solution.
- Approved data-sharing/retention terms and a mapped loan-tape/core export.

- 30-60 day parallel run with bank-owned thresholds, collection SLA and escalation process.
- Independent penetration test, restore drill, operational monitoring and incident contacts.

Verification status at issue: prior full E2E regression, OAuth smoke and production deploy completed successfully; the latest Ghana macro workflow run was in progress at the time of preparation.
